Technical Specifications for Confocal Raman Microscopy

We require a complete Confocal Raman microscopy system with a true Confocal benefits instead of virtual software controlled option with a 3-year onsite warranty from the date of installation.

Microscope should have a safety enclosure such that the scattered laser light from the sample is blocked. Frequencies in the units of cm^{-1} mentioned here are Raman shifts with respect to 532 nm excitation. Sum score of specifications and the price will be determined and bid will be awarded to the supplier with highest score. In this points based system, if there is any tie-up with the total score, any or all of the following are considered by the purchase committee. (i). quantum efficiency curve of the CCD will be employed where the area under the curve (quantum efficiency versus wavelength), (ii). noise levels of the CCD will be scored as mentioned in the case of specifications, (iii). various properties of the CCD, (iv). the lowest achievable temperature of the CCD under air cooling and (v). the optional abilities of the system.

- 1. Price weightage and scoring:** Prices will be normalized to the lowest value and the score will be given a 40% weightage. ie. P1, P2 and P3 are the prices among which let P2 is the lowest, then the score is defined as $S1 = 10 \div (P1 \div P2)$, $S2 = 10 \div (P2 \div P2)$ and $S3 = 10 \div (P3 \div P2)$. Weightage for the price is 40% hence $S1W = S1 \times 0.4$, $S2W = S2 \times 0.4$ and $S3W = S3 \times 0.4$.
- 2. Specification weightage and scoring:** 60% weightage will be given for each of the specifications. The following parameters with appropriate units will be considered for scoring: step size XY, repeatability XY, step size Z, repeatability Z, spot size, axial resolution, spectral repeatability, spectral scanning linearity/stability, low wave-number cut off, spectrometer throughput percentage and spectral resolution (FWHM). To determine the score, the best values among the suppliers will be identified. For instance, to determine the score of each supplier for category ‘spectral resolution’, let R1, R2 and R3 are spectral resolutions given for three different systems among which R2 is the best. Then the score for spectral resolution is defined as $SR1 = 10 \div (R1 \div R2)$, $SR2 = 10 \div (R2 \div$

“Supply and Installation of Confocal Raman Microscopy Setup”

R2) and $SR3 = 10 \div (R3 \div R2)$. Weightage for the specifications is 60%, hence $SR1W = S1 \times 0.6$, $SR2W = S2 \times 0.6$ and $SR3W = S3 \times 0.6$ are the scores for three systems, respectively.

3. **Total score:** Sum of $S1W$ and $SR1W$ gives the score for the supplier 1 on a given category. Similarly, $S2W + SR2W$ and $S3W + SR3W$ indicate the score for supplier 2 and 3 respectively. This scoring would be applied on all of the specifications listed in section 2.

In the following we have given the specifications of the system (microscope + spectrometer).

Confocal Microscope:

Research grade confocal microscope with viewing facility through a color video camera (1.3 Mega pixel minimum). White light illumination of the sample can be Kohler type any other way that mimics the Kohler illumination. Microscope should have a minimum 5X objective turret and should consists of 20x, 50x and 100x objectives. Sample stage: 100 mm x 75 mm in X and Y directions, 25 mm in Z direction are minimum dimensions. The stage should be adaptable to fit larger sizes in Z direction. Motorized stage is required with a joystick controller to position and focus the sample properly. Spot size: Diffraction limited spot size of (250 nm at 532 nm) is highly recommended, however, cannot be greater than 500 nm. Lateral resolution of Raman mapping is taken as equal to the spot size while determining the score. No software deconvolution is taken into account while calculating the score related to spot size. Suppliers need to provide us with a beam profile while varying Z-axis. This allows us to determine the waist of the beam and hence the axial resolution during Raman mapping. Axial resolution should be lower than 1000 nm with 532 nm laser excitation, without any software-deconvolution. Also all the suppliers should reveal us the method of software deconvolution in any case.

Raman mapping system:

Step size XY(nm): 50 nm step is the minimum; Repeatability XY (nm): 0.02% or better; Step size Z (nm): 10 nm or better; Repeatability Z (nm): 0.01%

Raman Spectrometer:

High throughput, aberration corrected spectrometer needs to be employed. The signal can be coupled through optical fiber or directly from the microscope. Focal length of the spectrometer should be greater than or equal to 250 mm. We need low and high wave number cut offs as minimum of 50 cm^{-1} and 4000 cm^{-1} , respectively. However, in the case of low wave number better than 50 cm^{-1} may be provided. Full range ($\leq 50 \text{ cm}^{-1}$ to 4000 cm^{-1}) should be covered without any spectral stitching. Three gratings need to be provided with the spectrometer system. We need a

“Supply and Installation of Confocal Raman Microscopy Setup”

spectral resolution (FWHM) 0.5 cm^{-1} at 532 nm with a peak position accuracy of 0.05 cm^{-1} . Furthermore, the required spectral repeatability is 0.1 cm^{-1} or better. Also, the spectral scanning linearity/stability is 0.05 cm^{-1} or better. We should be able to perform photoluminescence spectroscopy (200 nm-1100 nm) mapping without any need to change the hardware. Hence the characteristics of gratings (e.g lines/mm) should take into account of all of these parameters. The supplier is requested to indicate the throughput (%) of the spectrometer, which will be used in the scoring as indicated earlier.

CCD Detector:

We need a Peltier cooled detector with active pixels minimum 1024×256 or better. Pixel size can be 13 to 26 micrometer, however, should be taken into account with respect to the required spectral resolution and the grating employed. The required spectral coverage is 200 nm – 1100 nm. The minimum lowest temperature of the sensor is -60 deg C when air cooled. Quantum Efficiency $>70\%$ at 532nm. The lowest Quantum efficiency at any wavelength within (200 nm-1050 nm) should be better than 8% in any wavelength range.

LASER:

Polarization ready solid-state air-cooled diode LASER of 532 nm is needed for the system. The life-time of the laser shouldn't be less than 10,000 hours at the time of installation. Laser can be coupled to the microscope through fibre or directly. In the case of fibre coupling, the coupling should be of single mode and polarization maintaining. There should not be any alignment issues either in the case of fibre or direct coupling. In the case of fibre and direct coupling, laser power of $>30 \text{ mW}$, $>100 \text{ mW}$ are required, respectively. We also need a power control on the laser with a resolution of 0.1 mW accuracy with a complete span of 0 to 100% continuously. This can be a pre-calibrated control either manual or computer controlled. In the case of manual version, the control should be easily accessible to the user. The required output power stability is $\pm 1\%$.

Alignment / Calibration:

System should have alignment and calibration tools including pin-holes and light sources such as Hg or Hg/Ar lamp to cover the entire spectral range.

Hardware control and image processing software:

Should have feature for optimization of Raman Signals in case of samples showing poor Raman signals. Raman images must be generated for multiple points, line array maps, or area maps

“Supply and Installation of Confocal Raman Microscopy Setup”

including Confocal measurements and 3D images. Software should have advanced cluster analysis tools to process Raman images like Principal Component Analysis, Multivariate Analysis to identify the best possible components present in the maps. Principle components can be processed further for individual component spectra. Additional options to develop different profiles like Correlation map, peak area, peak height maps etc., must be possible. We require 2 software licenses for image analysis, other than the one connected to the hardware of the instrument. The principle should upgrade or update the software when needed and should not have any expiry date.

Controller:

Advanced digital controller with current generation electronics for the complete operation of the system and software as listed above. The system must be automated to allow great deal of software control including calibration routines using in-built or external calibration samples, experimental set up and the like. A single controller should be capable of integrating multiple spectrometers. The controller should be able to accommodate Atomic Force Microscope and Scanning Near-Field Optical Microscopy.

Desktop Computer and monitor:

The computer should consist of Intel 8th generation Core i7 series Quad Core Processor or better with 1 TB HDD or higher storage capacity. We need windows 10 operating system on the computer. RAM: minimum of 8 GB DDR4 RAM (8GB should be within a single slot). After complete installation of Raman system, the motherboard should have at least two empty PCI card holders for other upgradations. We also require a LED monitor of 24” size or bigger.

Battery backup:

The complete system (computer + monitor + laser + spectrometer + CCD) should have battery backup of 30 min.

Installation and training: On-site installation and training by an experienced engineer.

Optional abilities:

1. Capability to integrated Fluorescence Lifetime Imaging (FLIM) and Total Internal Reflection Microscopy (TIRF) on the same electronics

“Supply and Installation of Confocal Raman Microscopy Setup”

2. Capability to integrated optical profilometry on the same electronics, thereby making a system for correlated microscopy.
